DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-16 are rejected under 35 U.S.C. 102(b) as being anticipated by Berger et al. (5,510,981)

As to claims 1-3, Berger teaches a computer implemented method for natural language translation of a source/first language into a target/second language, comprising the steps of:

Receiving a source text and generating at least two target hypothesis (translations);

Calculating a "target hypothesis match score" (translation probability) that is a combination of two different models which are <u>a language model match score</u> and <u>a</u> translation match score; and

Identifying and outputting the translation with the highest translation probability (abstract; Fig.1)

As to claim 4, Berger teaches where the source language is translated using a bilingual dictionary (Fig.1, 14).

Application/Control Number: 09/757,836

Art Unit: 2655

As to claim 5, Berger teaches where the translation match score includes probability of the occurrence of the source given the target word in one of the target hypothesis (abstract).

Claims 6-16 are analogous to claims 1-5 and are rejected for the foregoing reasons by Berger.

Response to Arguments

Applicant's arguments with respect to claims 1-16 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Brown et al. (5,477,451) also teaches as shown below the subject matter of the present invention

'The source text is first transduced into one or more intermediate structural representations. From these intermediate source structures a set of intermediate targetstructure hypotheses is generated. These hypotheses are scored by two different models: a language model which assigns a probability or score to an intermediate target structure, and a translation model which assigns a probability or score to the event that an intermediate target structure is translated into an intermediate source structure. Scores from the translation model and language model are combined into a combined

Application/Control Number: 09/757,836

Art Unit: 2655

score for each intermediate target-structure hypothesis. Finally, a set of target-text hypotheses is produced by transducing the highest scoring target-structure hypotheses into portions of text in the target language.' See the abstract.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Daniel D Abebe whose telephone number is 703-308-5543. The examiner can normally be reached on monday-friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Doris To can be reached on 703-305-4827. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
